Research Summary

A water flosser, also known as an oral irrigator or dental water jet, is a device used for oral hygiene that utilizes a stream of pulsating water to remove plaque, food particles, and debris from between teeth and along the gumline. Water flossers typically consist of a handheld wand or unit connected to a water reservoir. When activated, the water is pressurized and expelled through a nozzle in a controlled manner, allowing users to direct the stream of water along their teeth and gums to dislodge and flush away trapped particles. Water flossers are often used as an alternative to traditional dental flossing or in conjunction with brushing to complement daily oral hygiene routines. They are particularly beneficial for individuals with braces, dental implants, or dental work, as well as those with sensitive gums or difficulty using traditional floss. Water flossers can help improve gum health, reduce plaque buildup, and promote overall oral hygiene when used regularly as part of a comprehensive dental care regimen.
