Research Summary

Water softener systems are devices used to reduce the hardness of water by removing dissolved minerals, primarily calcium and magnesium ions, which can cause scale buildup and other issues. These systems typically use ion exchange or salt-based technology to exchange calcium and magnesium ions in the water with sodium or potassium ions, effectively softening the water. Water softeners consist of a tank filled with resin beads coated with positively charged sodium or potassium ions. As hard water passes through the resin bed, the calcium and magnesium ions in the water are attracted to the resin beads and exchanged for sodium or potassium ions. The softened water is then distributed throughout the plumbing system, providing benefits such as reduced scale buildup on pipes and fixtures, improved lathering and soap efficiency, and softer skin and hair. Periodically, the resin bed needs to be regenerated by flushing it with a brine solution containing sodium or potassium chloride, which replenishes the resin beads with fresh sodium or potassium ions. Water softener systems are commonly used in residential, commercial, and industrial applications to improve water quality and protect plumbing infrastructure from the damaging effects of hard water.

The major global manufacturers of Water Softener Systems include EcoWater Systems, Culligan, BWT AG, Haier(GE), Whirlpool Corporation, 3M, A.O.
