### Research Summary

A website vulnerability scanner is a cybersecurity tool designed to identify and assess security weaknesses or vulnerabilities in a website or web application. These scanners systematically analyze web pages, server configurations, and other elements of a website to detect potential vulnerabilities such as SQL injection, cross-site scripting (XSS), insecure authentication mechanisms, and outdated software versions. Once vulnerabilities are identified, the scanner typically generates a detailed report outlining the discovered issues along with recommendations for remediation. Website vulnerability scanners help organizations proactively identify and address security risks, thereby reducing the likelihood of exploitation by malicious actors and protecting sensitive data from unauthorized access or manipulation.
