Research Summary

Welded H beams, also known as welded H-shaped steel beams, are structural steel beams that are fabricated by welding together two flanges and a web to form an H shape. These beams are commonly used in construction and engineering projects to provide structural support for buildings, bridges, and other structures. Welded H beams are made from hot-rolled steel or welded from steel plates and are characterized by their high strength-to-weight ratio, which makes them suitable for supporting heavy loads over long spans. They offer excellent load-bearing capacity and resistance to bending and twisting forces, making them ideal for use in applications where structural stability and durability are essential. Welded H beams are typically produced in a wide range of sizes and dimensions to meet specific design requirements, and they can be customized with additional features such as holes or cutouts for attaching other structural components. Overall, welded H beams are versatile and cost-effective solutions for various structural applications in construction and engineering projects.
