Research Summary

A wireless mesh network is a decentralized network topology where interconnected nodes communicate wirelessly with each other to relay data across the network. Unlike traditional network setups with centralized access points, each node in a wireless mesh network can act as a router and relay data to other nodes, creating a mesh-like structure. This self-configuring and self-healing network architecture allows for dynamic routing of data packets, enhancing network resilience, scalability, and coverage. Wireless mesh networks are commonly used in scenarios where reliable and flexible wireless communication is needed over a large area, such as in smart cities, industrial automation, outdoor deployments, and situations requiring disaster recovery or temporary network setups. They offer advantages such as improved network reliability, redundancy, and adaptability to changing network conditions or node configurations.

The major global suppliers of Wireless Mesh Network include Strix Systems Incorporated, ABB, Cisco Systems, Digi International, Aruba Networks, General Dynamics Mission Systems, Cambium Networks, Synapse Wireless, Vigilent, Firetide,

Rajant Corporation, Fluidmesh Networks, ArrowSpan, Concentris Systems, etc. The global players competition landscape in this report is divided into three tiers.
