Research Summary

Wood-fiber gypsum board, also known as wood fiber-reinforced gypsum board or simply wood fiber board, is a type of building material used for interior wall and ceiling construction. It is composed of a core made from a mixture of gypsum plaster and wood fibers, typically sourced from recycled paper or wood chips. The combination of gypsum and wood fibers creates a lightweight yet strong panel that offers enhanced sound insulation, fire resistance, and impact resistance compared to traditional gypsum boards. Wood-fiber gypsum boards are available in various thicknesses and sizes to suit different construction requirements and can be easily installed using standard drywall techniques. They are commonly used in residential, commercial, and institutional buildings for partition walls, ceilings, and other interior applications where sound control, fire safety, and durability are important considerations. Additionally, the use of recycled wood fibers in these boards contributes to sustainability in building practices by reducing waste and promoting eco-friendly materials.
