Research Summary

Wood veneer sheets are thin slices or layers of wood, typically around 0.6 to 6 millimeters thick, that are peeled, sliced, or sawn from a larger piece of wood called a flitch or log. These veneer sheets are used to cover the surfaces of furniture, cabinets, doors, panels, and decorative items to achieve the appearance of solid wood at a lower cost. Wood veneers are available in a wide range of wood species, grains, colors, and patterns, allowing for versatile design options in woodworking projects. Common methods of cutting veneer sheets include rotary cutting (peeling the log in a continuous ribbon), plain slicing (cutting across the log like slicing bread), quarter slicing (cutting at a 90-degree angle to the growth rings for a straight grain pattern), and rift cutting (cutting at a slight angle to produce a straight grain with minimal figure). Veneer sheets are bonded to substrate materials such as plywood, particleboard, or MDF using adhesives and pressure to create veneered panels that combine the aesthetics of wood with the structural stability of engineered wood products. Wood veneer sheets offer the beauty, natural variation, and elegance of real wood while maximizing material efficiency and minimizing costs in woodworking and interior design projects.

The major global manufacturers of Wood Veneer Sheets include Samling Group, Samko Timber, Oakwood Veneer, CenturyPly, Greenlam Industries, UPM, Flexible Materials, Cedan Industries, Pearlman Veneers, Herzog Veneers, TURAKHIA OVERSEAS, FormWood Industries, SR Wood, etc. The global players competition landscape in this report is divided into three tiers.
