### Research Summary

Xylan is a complex carbohydrate polymer belonging to the group of hemicelluloses, which are polysaccharides found in plant cell walls. It is composed of xylose sugar units linked together in chains, often with other sugar residues such as arabinose and glucuronic acid. Xylan serves a structural role in plants, providing strength and rigidity to cell walls alongside cellulose and lignin. It is particularly abundant in hardwoods such as birch and beech, as well as in grasses and agricultural residues like corn stover and wheat straw. Industrially, xylan can be extracted from plant biomass and used in various applications such as food additives, pharmaceuticals, papermaking, and as a source of fermentable sugars for biofuel production through enzymatic hydrolysis processes. Due to its renewable and biodegradable nature, xylan has gained attention as a sustainable resource for multiple industries seeking eco-friendly alternatives.
