### Research Summary

Yellow and white dextrins are types of carbohydrate-based powders derived from starch through controlled hydrolysis processes. Yellow dextrins are produced by heating starch in the presence of a catalyst such as acid or enzymes, followed by a shorter drying period, resulting in a yellowish-brown powder. They exhibit good adhesive properties when mixed with water, making them valuable in industries such as paper and textiles for bonding and sizing applications. On the other hand, white dextrins are obtained by heating starch at higher temperatures for a longer duration, leading to a white or off-white powder. White dextrins are soluble in water and find use in industries such as food, pharmaceuticals, and adhesives for their binding, thickening, and stabilizing properties. Both yellow and white dextrins are versatile additives with distinct characteristics suitable for various industrial and commercial applications.
