Research Summary

A zeolite-based catalyst is a type of catalyst that incorporates zeolites, which are microporous, aluminosilicate minerals known for their high surface area, tunable pore sizes, and excellent thermal and chemical stability. These catalysts are extensively used in petrochemical and refining industries to facilitate various chemical reactions, such as hydrocracking, fluid catalytic cracking (FCC), and isomerization. The unique structure of zeolites allows them to selectively adsorb molecules based on size and shape, making them highly effective in promoting reactions with high specificity and efficiency. Zeolite-based catalysts play a critical role in producing high-octane gasoline, diesel, and other valuable hydrocarbons from crude oil, as well as in the synthesis of fine chemicals and environmental applications like removing nitrogen oxides (NOx) from exhaust gases. Their versatility and effectiveness make them indispensable in modern chemical processes.

The major global manufacturers of Zeolite-based Catalyst include Clariant, Eurecat, NCCP, SACHEM, Exxon Mobil Chemical, Honeywell, etc. The global players
