## Abstracts

Firstview Insight's Cystic fibrosis - Pipeline Review, 2019 provides an overview of the pipeline landscape of Cystic fibrosis. It provides comprehensive insights of all the clinical and non-clinical therapeutics in development with detailed description about the collaborations; deals; designations; patent information etc. These reports encourage the clients in distinguishing the upcoming and existing competitors in their separate therapeutic spaces. The report provides detailed description of the competitor profiles with key milestones and evidence along with analysis by mechanism of action; route of administration; molecule type; stage of development. Information obtained from multiple sources will be used to triangulate and update the profiles. The report also provides key events in the last year related to the indication. This report provides detailed analysis of all the products along with the companies involved.

Cystic fibrosis is a genetic disorder that often affects multiple organ systems of the body. Cystic fibrosis is characterized by abnormalities affecting certain glands (exocrine) of the body especially those that produce mucus. Saliva and sweat glands may also be affected. Exocrine glands secrete substances through ducts, either internally (e.g., glands in the lungs) or externally (e.g., sweat glands). In cystic fibrosis, these secretions become abnormally thick and can clog up vital areas of the body causing inflammation, obstruction and infection.
