## Abstracts

Firstview Insight's Fanconi Anemia - Pipeline Review-2019 provides an overview of the pipeline landscape of Fanconi Anemia. It provides comprehensive insights of all the clinical and non-clinical therapeutics in development with detailed description about the collaborations; deals; designations; patent information etc. These reports encourage the clients in distinguishing the upcoming and existing competitors in their separate therapeutic spaces. The report provides detailed description of the competitor profiles with key milestones and evidence along with analysis by mechanism of action; route of administration; molecule type; stage of development. Information obtained from multiple sources will be used to triangulate and update the profiles. The report also provides key events in the last year related to the indication. This report provides detailed analysis of all the products along with the companies involved.

Fanconi syndrome is a rare disorder of kidney tubule function that results in excess amounts of glucose, bicarbonate, phosphates (phosphorus salts), uric acid, potassium, and certain amino acids being excreted in the urine. Fanconi syndrome is unrelated to—and should not be confused with—Fanconi anemia.

Fanconi syndrome may be hereditary or may be caused by

Exposure to certain drugs (including some chemotherapy and antiretroviral drugs)

Exposure to heavy metals or other chemicals

Vitamin D deficiency

Kidney transplantation In hereditary Fanconi syndrome, symptoms of excessive drinking and excessive urination usually begin during infancy.

A child with Fanconi syndrome and cystinosis may have failure to thrive, slowed growth, and chronic kidney disease. Kidney failure may require a kidney transplant during childhood.

In adults, symptoms may not develop until the disorder has been present for some time. The most common symptoms in adults include weakness and bone pain.

Multiple myeloma

Amyloidosis
