Abstracts

Graphene continues to be one of the most promising advanced materials with exceptional electrical, mechanical and thermal properties. While adoption is rapidly increasing, the global graphene market remains in a formative stage with commercial production ramping up. However the market is projected to grow at an accelerated rate, heightened deployment across sectors like energy storage, electronics and composites manufacturing. Applications currently leading demand include conductive components, transistors for RF equipment, biosensors for pathogen detection and thermal management solutions. Larger scale markets like automotive composites and construction materials incorporating graphene for structural reinforcement are forecast to contribute significantly to growth over the next decade. Production scale up continues with major capacity additions announced across North America, Europe and Asia to serve rising interest from downstream industries. This is promoting improved availability at reduced prices - further aiding penetration of graphene into polymer, metal-matrix composites and coatings. While the industry has faced prior oversupply and quality control concerns, end-user feedback indicates increasing product reliability and measurement process standardization.

The Global Market for Graphene 2024-2035 provides a comprehensive analysis of the global graphene market including granular demand forecasts in tons and revenue projections in millions USD across key application segments like batteries, sensors, transistors, composites, construction, lighting and biomedical.
