## Abstracts

Biobased composites (Biocomposites) are generally referred to as composites with either reinforcement or matrix derived from natural sources, or encompassing both (full biocomposites). Biocomposites are produced from naturally-renewable and abundant precursor feedstocks, and possess properties equivalent, on a weight basis, to their synthetic counterparts. Issues with recycling and the underlying environmental concerns regarding synthetic based composites is driving growing interest in biocomposites.

The most commonly used types of biocomposites are Wood-Plastic Composites (WPC) and Natural Fibre Composites (NFC). Natural and wood fibers are combined with petrochemical or bio-based polymers to achieve enhanced mechanical and lightweight properties. Thermoplastic and thermosetting polymers are also increasingly being developed from bio-based chemicals and natural materials such as mycelium and alginate.
