Abstracts

Future research and development needs are dependent upon the capacity of instrumentation to measure, sense, fabricate, and manipulate matter at the nanoscale. Electron microscopy has the advantage over other characterisation techniques (e.g., bulk spectroscopy or electrical testing) in that it is descriptive, producing images of objects that are directly related to their structure, morphology, and composition, and hence it directly uncovers spatial heterogeneities. This is crucial in semiconductors manufacturing and advanced technology industrial R&D. In addition to the need for ultra-high-resolution imaging, demand for high-precision prior sample processing and high sensitivity electron microscopes has grown in fields including the environment and new energy, new materials, and life sciences

The Global Market for Electron Microscopes 2023-2033 presents an in-depth analysis of the electron microscopes market by products, revenues, markets and companies.
