Abstracts

Graphene quantum dots (GQDs) represent relatively new members of the carbon nanomaterials family. Studies have demonstrated that quantum confinement could appear in graphene with finite size and edge effects-graphene quantum dots (GQDs). GQDs display properties derived from both graphene and quantum dots (QDs), combining the structure of graphene with the edge effects, non-zero band gap, and quantum confinement effects of QDs. They possess unique optical and electrical properties such as:

high quantum yield

high electrical conductivity

high thermal conductivity

excellent photostability

biocompatibility

superior stability compared to non-carbon QDs.

highly tunable photoluminescence (PL)

electrochemiluminescence

exceptional multi-photon excitation (up-conversion) property

ease of functionalization

low-toxicity.

As a result, they are being widely investigated for applications in optoelectronics, photonics, biomedicine, energy storage and conversion, anti-counterfeiting and sensors.
