Abstracts

Smart coatings are coating systems that are capable of responding dynamically to external changes in their environment. These types of coatings elicit a sensory response to environmental stimuli such as changes in temperature or current and respond accordingly.

Although smart coatings are not new, the growing development of nanotechnology and advanced materials has opened new avenues for multi-functional coatings that sense and react to stress, pressure, corrosion, radiation and biological stimuli. The incorporation of multi-functional, smart nanofillers to polymer matrix results in a range of unique properties.

Examples of smart coatings include stimuli responsive, conductive, self-healing, and super hydrophobic systems. This report assesses the latest technical developments in the smart coatings market including:
