Abstracts

An alkanolamide composition is prepared from a detergent grade fatty acid via an intermediate in the form of an alkoxyated derivative thereof to provide a high active content product wherein the active component consists essentially of the alkanolamide. Alkanolamides are often used to impart foam stability and are used in conjunction with other surfactants. They perform by causing the molecular film at the surface of the foam bubble to become closely packed. The carbon chain length of the alkanolamide should be close to the carbon chain length of the surfactant with which the amide is being used.

The alkanolamides find extensive use in a variety of liquid detergent preparations wherein they primarily serve to promote or boost the foaming ability of the anionic surfactant component of the preparation as well as to stabilize the foam. Examples of such preparations include dishwashing liquids, shampoos, bubble bath formulations, light floor and wall cleaners, etc.
