## Abstracts

An atmospheric water generator (AWG) is a device that extracts water from humid ambient air. It condenses moisture via cooling so that liquid water can be captured and stored or consumed. Atmospheric water generators function by passing air through a cool evaporator coil or heating exchange column. As the air comes into contact with the cool surface, its water vapor condenses into liquid water droplets. The condensed water is then collected in a collection tank.

Some atmospheric water generator models work by compressing air and further decreasing the temperature until water vapor condenses. The condensed water is then filtered before storage. These systems have a variety of applications. In arid regions with limited water resources, they provide usable water for industrial, agricultural, and residential needs. Some large installations can produce thousands of liters of water per day.

According to the latest research, the global atmospheric water generator market is poised to grow by USD 1.3 billion during 2023-2029, progressing at a CAGR of 8.1% during the forecast period.
