Antennas are a very important component of communication systems. By definition, an antenna is a device used to transform an RF signal, traveling on a conductor, into an electromagnetic wave in free space. The global base station antenna market size was valued at \$3,836.65 million in 2019 and is projected to reach \$6,323.53 million by 2024, registering a CAGR of 10.51% from 2020 to 2024.

The market for base station antennas is developing very dynamically. To ensure that the demand for growing data transmission capacities is well met, antennas are developed to be more efficient and complex. One of the more exciting elements within the antenna environment is the evolution between passive and active antennas. An active antenna is one that has active electronic components (i.e., transistors) and is not simply composed of passive parts such as metal rods, capacitors, and conductors. Included in this category are smart antennas, remote radio head antennas, and beamforming antennas. These will all play an increasingly important role in the network, and the ratio of active antennas is estimated to grow from nearly 6 percent in 2017 to over 13 percent by 2024. Much of this growth will be driven by MIMO and Massive MIMO configurations.

The base station antenna market is segmented on the basis of application, and region. By application, the base station antenna market is classified into 2G, 3G, 4G, 5G. On the basis of region, the base station antenna industry is analyzed across North America, Europe, Asia-Pacific, South America and MEA (the Middle East, and Africa).
