Abstracts

Breast pumps are devices used by lactating mothers to extract milk from their breasts. They are commonly used to collect and store breast milk for later use, such as when the mother is away from her baby or to maintain milk supply. There are different types of breast pumps, including manual, electric, and battery-powered models. They are designed to mimic the sucking action of a nursing baby, stimulating milk flow and allowing the mother to express milk efficiently. Breast pumps can be an essential tool for mothers who need to express milk regularly or for those who have difficulty nursing their babies directly.
