Abstracts

As a synthetic phenolic antioxidant, butylated hydroxyanisole (BHA) is a commonly used fat soluble preservative in foods containing fats, which turn rancid by oxidation. First used as an antioxidant in 1947, it is now added to a wide variety of foods, including beverages, ice cream, candy, baked goods, instant mashed potatoes, edible fats and oils, breakfast cereals, dry yeast, and sausages. It prevents spoilage by reacting with oxygen. It slows down development of off-flavors, odors and color changes caused by oxidation. It protects animals against radiation and the acute toxicity of various xenobiotics and mutagens.
