## Abstracts

Carboxymethyl cellulose (CMC) is an anionic, water-soluble polymer derived from cellulose that features unique properties of outstanding adherence, water absorption, and water retention. CMC is produced commercially in a two-stage process consisting of a mercerization stage followed by an etherification stage. It is commercially sold as sodium salt and scientifically known as sodium carboxymethylcellulose (Na-CMC).

The global carboxymethyl cellulose market size was valued at \$1,333.57 million in 2019 and is projected to reach \$1,793.04 million by 2026, registering a CAGR of 4.32% from 2020 to 2026. Carboxymethyl cellulose is used in various end-use industries such as food & beverages, oil & gas, pharmaceuticals, paints & coatings, textile, cosmetics & personal care, paper making, household care, and others. Demand for healthy food and beverage products, expansion in global pharmaceuticals markets are major drivers increasing demand for CMC in the next five years.
