Abstracts

A dehumidifier is a device that removes moisture from the air by condensing it into liquid water. Working on the same principle as a refrigerator, moisture-filled air is drawn into the dehumidifier and passed over a cold, refrigerated coil. The damp air condenses on the cold coil into water droplets which are collected in the water tank. The air is then passed over a warm coil and sent out from the dehumidifier, producing clean, dry air. According to Gen Consulting Company, the global dehumidifiers market size is expected to increase from USD 2,347 million in 2020 to USD 2,906 million by 2027, garnering a CAGR of 3.1% over the evaluated period.
