## Abstracts

Dialyzers are medical devices used in hemodialysis to remove waste products and excess fluids from the blood of patients with kidney failure. The dialyzer is an artificial semipermeable membrane that is designed to maximize diffusive or convective clearance, or provide a combination of both, and is tailored to the individual patient's needs depending on clinical circumstances. The most common design used today is the hollow-fiber dialyzer, which consists of a plastic cartridge traversed by several thousand thin hollow fibers, each with microscopic fenestrations that permit the passage of water and other small molecules. The global dialyzers market is projected to rise by USD 1.9 billion by 2029, according to the latest market study results. It is anticipated to expand at a CAGR of 6.2 percent during the forecast period. The growth of the dialyzer market is driven by various factors such as increasing demand for hemodialysis, rising prevalence of kidney diseases, favorable health reimbursement, and proven higher efficiency of high-flux dialyzers.
