Abstracts

Foam glass, otherwise known as cellular glass is a lightweight, opaque glass material having a closed-cell structure. It is made in molds that are packed with crushed or granulated glass mixed with a chemical agent such as carbon or limestone. Foam glass is a novel gassy material and is a kind of thermal insulation, not flammable building material, in which there are numerous closed tiny pores. There are many advantages about it, such as light weight, high strength, and low thermal conductivity.

The global foam glass market size was valued at \$1,297.34 million in 2019 and is projected to reach \$2,021.38 million by 2026, registering a CAGR of 6.54% from 2020 to 2026. Foam glass is extremely versatile because of its unique characteristics of light weight, load bearing, draining and insulating properties. Foamed glass is a sustainable replacement for traditional building materials in insulation of basements, under the slab as well as backfill, new floor in old buildings, insulation of rooftops, lightweight fill material for landscaping, roof gardens, green roofs, road construction where pressure resistant light weight fill is required, bridge abutments and other construction where light weight fill is required, insulating of underground pipelines and etc.

The foam glass market is segmented on the basis of application, and region. By application, the foam glass market is classified into Building, Infrastructure, Chemical & Industrial, Gardening & Landscaping, Agricultural & Water Treatment.
