Abstracts

Geosynthetic Clay Liners (GCL) are high performance geocomposites that are used as an alternative to conventional compacted clay liners. GCLs consist of two layers of geotextile stitched together enclosing a layer of processed sodium bentonite. Bentonite is a natural sealant, and when in contact with water, swells to form a low permeability clay liner. GCLs have a long lasting resistance to physical and chemical break-down in harsh environments such as landfills and other containment systems.

The report covers forecast and analysis for the geosynthetic clay liner market on a global and regional level. The study provides historic data of 2012-2016 along with a forecast from 2017 to 2022 based on both volumes and revenue.
