Abstracts

Laser hair removal is a medical procedure that uses a concentrated beam of light (laser) to remove unwanted hair. During laser hair removal, a laser emits a light that is absorbed by the pigment (melanin) in the hair. The light energy is converted to heat, which damages the tube-shaped sacs within the skin (hair follicles) that produce hairs. This damage inhibits or delays future hair growth. The global laser hair removal market was estimated at USD 817 million in 2022 and is expected to hit USD 1,961 million by 2029, registering a CAGR of 13.3% from 2023 to 2029 as per the latest report by Gen Consulting Company.
