Abstracts

Magnesium chloride is the name for the chemical compounds with the formulas $MgCl_2$ and its various hydrates $MgCl_2(H_2O)_x$. These salts are typical ionic halides, being highly soluble in water. The hydrated magnesium chloride can be extracted from brine or sea water. Anhydrous magnesium chloride is the principal precursor to magnesium metal, which is produced on a large scale. Hydrated magnesium chloride is the form most readily available.

Magnesium chloride is often found in non-beauty uses, such as food production (specifically tofu and baby milk) and anti-icing products. However, it is also taken as a supplement to regulate magnesium levels in the body, important for muscle and nerve maintenance.
