Abstracts

Metallocene is tiny particles of positively charged metal ions sandwiched between two rings of carbon atoms which have five atoms apiece. The advent of metallocene catalysts added a new dimension to commercial polyolefin resins. Metallocene catalysts have some unique advantages over conventional catalysts. Metallocene catalysts were first used to produce quantities of polypropylene in 1995, brand name Achieve by Exxon. Since then, metallocene polypropylene grades have been produced commercially and are delivering superior properties which are valuable in certain enduse market segments especially high MFI fiber grade and injection molded parts. According to Gen Consulting Company, global metallocene polypropylene market is projected to grow at a CAGR of 6.44% during the forecast period 2020-2026.
