## Abstracts

Microwave ablation (MWA) is a form of thermal ablation used in interventional radiology to treat cancer. MWA utilizes dielectric hysteresis to produce heat. Microwaves are capable of propagating through and effectively heating many types of tissue, even those with low electrical conductivity, high impedance, or low thermal conductivity. Microwave ablation works by producing electromagnetic waves in the microwave energy spectrum. These microwaves create heat around the needle, which heat and destroy the cancer cells. Heat closes small blood vessels and lessens the risk of bleeding. The dead tumor cells are gradually replaced by scar tissue. The microwave ablation system market is expected to grow by USD 54.87 million during 2020-2026, according to the latest research report by Gen Consulting Company.

By therapeutics, the microwave ablation system market is classified into Oncology, Cardiovascular, Urology, Gynecology.
