## Abstracts

Molecularly oriented polyvinyl chloride pipe (PVCO) was developed in Europe in the 1970's. It was developed as an improvement to conventional unplasticized PVC (or PVC-u). For a given nominal pressure, the biaxial orientation of the pipe material allows to double the tensile strength and increase flexibility and resistance to cyclic fatigue, with a reduction in weight. PVCO pipes are the best solution for medium and high pressure water networks for irrigation systems, potable water supply, fire extinguishing networks and pumping systems, among other applications. According to Gen Consulting Company, global molecularly oriented PVC pipe market is projected to grow at a CAGR of 7.8% during the forecast period 2020-2026.
