Abstracts

Magnetic resonance imaging (MRI) is a non-invasive imaging technology that produces three dimensional detailed anatomical images. It is often used for disease detection, diagnosis, and treatment monitoring. MRI scanners are particularly well suited to image the non-bony parts or soft tissues of the body. The brain, spinal cord and nerves, as well as muscles, ligaments, and tendons are seen much more clearly with MRI than with regular x-rays and CT, for this reason MRI is often used to image knee and shoulder injuries. According to Gen Consulting Company, the global MRI market is projected to reach USD 5,752 million, recording a CAGR of approximately 6.6 percent from 2022 to 2028.
