## Abstracts

A multilayer ceramic capacitor (MLCC) is an electronic component used to store and release electrical energy in electronic circuits. It is constructed from multiple layers of ceramic material, with alternating layers of metal acting as electrodes. The ceramic layers and metal electrodes are stacked together and then sintered to form a compact and efficient capacitor. MLCCs are known for their high capacitance values relative to their size, making them popular in a wide range of electronic devices, including smartphones, computers, and automotive electronics. They are valued for their stability, reliability, and ability to operate at high frequencies.

The global MLCC market is projected to rise by USD 4.3 billion by 2029, according to the latest market study results. It is anticipated to expand at a CAGR of 4.7 percent during the forecast period.
