## Abstracts

Normal fats, also referred to as common or basic fats, are the most commonly found fats in our diet. They are usually derived from plant and animal sources and include common cooking oils such as vegetable oil, olive oil, sunflower oil, and butter. Normal fats consist of triacylglycerols, which are composed of a glycerol molecule and three fatty acids. These fats are known to provide energy to the body and improve satiety by slowing down digestion. Specialty fats, on the other hand, are more complex fats that are refined or modified to have specific properties. They are often used in the production of processed foods to enhance texture, flavor, and shelf life. Specialty fats are categorized into functional, nutritional, and medical lipid-based products. The global normal and specialty fats market is projected to rise by USD 18.8 billion by 2029, according to the latest market study results.
