Abstracts

In a basic RFID system, tags are attached to all items that are to be tracked. These tags are made from a tiny tag-chip, sometimes called an integrated circuit (IC), which is connected to an antenna that can be built into many different kinds of tags including apparel hang tags, labels, and security tags, as well as a wide variety of industrial asset tags. The tag chip contains memory which stores the product's electronic product code (EPC) and other variable information so that it can be read and tracked by RFID readers anywhere. The global RFID tag market size was valued at \$1,556.54 million in 2019 and is projected to reach \$4,314.9 million by 2026, registering a CAGR of 15.68% from 2020 to 2026.
