## Abstracts

Silicon tetrachloride is the inorganic compound with the formula  $\text{SiCl}_4$ . It is a colourless volatile liquid that fumes in air. It is used to produce high purity silicon and silica for commercial applications.

Silicon tetrachloride is used as an intermediate in the manufacture of polysilicon, a hyper pure form of silicon, since it has a boiling point convenient for purification by repeated fractional distillation. It is reduced to trichlorosilane ( $\text{HSiCl}_3$ ) by hydrogen gas in a hydrogenation reactor, and either directly used in the Siemens process or further reduced to silane ( $\text{SiH}_4$ ) and injected into a fluidized bed reactor. Silicon tetrachloride reappears in both these two processes as a by-product and is recycled in the hydrogenation reactor. The produced polysilicon is used as wafers in large amounts by the photovoltaic industry for conventional solar cells made of crystalline silicon and also by the semiconductor industry.

The report covers forecast and analysis for the silicon tetrachloride market on a global and regional level. The study provides historic data of 2012-2016 along with a forecast from 2017 to 2022 based on both volumes and revenue.
