Abstracts

Squalane is derived by hydrogenation of squalene. It is naturally present in the skin lipid barrier of plants, animals and humans, preventing moisture loss while restoring skin's suppleness and flexibility. In contrast to squalene, due to the complete saturation of squalane, it is not subject to auto-oxidation. This fact, coupled with lower costs associated with squalane, make it desirable in cosmetic applications. Squalene is a high-end, oil-free moisturizing ingredient used in many cosmetics that, until recently, was extracted primarily from the liver of deep sea sharks. Squalene is quickly absorbed into the skin without leaving an oily residue and also mixes well with other oils, which will augment its demand in personal care and cosmetic products. Squalene is also used in the manufacture of vaccines. The global squalane market is likely to register a CAGR of over 8.4% with an incremental growth of USD 97 million during the forecast period 2022-2028.
