## Abstracts

A stepper motor is a type of electric motor that converts electrical pulses into precise mechanical movements. It is a digital version of a motor, where the rotation is broken down into small steps, allowing for precise control of the motor's position and speed. Stepper motors typically have multiple coils that are energized in a specific sequence to create the stepping motion. The number of steps per revolution is determined by the number of teeth on the rotor and the number of energized coils. Stepper motors are commonly used in applications that require precise control of movement, such as robotics, CNC machines, and 3D printers. They are also used in industrial automation, medical equipment, and scientific instruments. The analysis predicts the global stepper motor market will grow from USD 1,065.0 million in 2022 to USD 1,297.0 million by 2029, achieving a compound annual growth rate (CAGR) of 2.77 percent.
