## Abstracts

Strain sensors are used to measure deformations of structures and the stresses that cause them. A strain sensor converts force, pressure, tension, weight, etc., into a change in electrical resistance which can then be measured. When external forces are applied to a stationary object, stress and strain are the result. Strain sensors can be used to weigh, control overloads, or control forces in industrial processes.

The report covers forecast and analysis for the strain sensor market on a global and regional level. The study provides historic data of 2012-2016 along with a forecast from 2017 to 2022 based on both volumes and revenue.
