Urea formaldehyde (UF) resin, sometimes called urea-formaldehyde, also known as urea-methanal, so named for its common synthesis pathway and overall structure, is an opaque thermosetting resin or plastic, made from urea and formaldehyde heated in the presence of a mild base such as ammonia or pyridine. The chemical structure of UF resins can be described as that of an aldehyde condensation polymer. This description leaves the details of the structure undetermined, which can vary linearly and branched. These are grouped by their average molar mass and the content of different functional groups. Changing synthesis conditions of the resins give good designing possibilities for the structure and resin properties.
