## Abstracts

Heat exchangers are devices that transfer heat from one fluid to another, without the fluids coming into direct contact with each other. They are commonly used in a variety of industrial applications, such as power generation, chemical processing, and HVAC systems. Heat exchangers work by creating a barrier between the two fluids, allowing heat to be transferred from the hotter fluid to the cooler fluid. This is typically accomplished using a series of plates or tubes, which provide a large surface area for heat transfer to occur. The heat exchangers market in North America is projected to rise by USD 1.4 billion by 2029, according to the latest market study results.
