## Abstracts

Titanium dioxide (TiO<sub>2</sub>) is a naturally occurring mineral that finds extensive usage as a white pigment in various industries, including paint, coatings, plastics, paper, and cosmetics. It possesses high opacifying properties, which makes it an effective substance for rendering products more opaque or less transparent. TiO<sub>2</sub> is also employed as a UV filter in sunscreens and as a catalyst in chemical reactions. It is a non-toxic and chemically inert substance, thereby qualifying as a safe substance for human use. TiO<sub>2</sub> is produced through a chemical process that involves the extraction of titanium from minerals such as ilmenite and rutile. The extracted titanium undergoes a high-temperature process known as calcination to yield TiO<sub>2</sub>. TiO<sub>2</sub> is available in different grades, ranging from high-purity grades used in pharmaceuticals to lower-purity grades used in industrial applications. The titanium dioxide market in Europe is likely to register a CAGR of over 6.1% with an incremental growth of USD 1.8 billion during the forecast period 2023-2029.
