Abstracts

Ulcerative colitis (UC) is a chronic inflammatory bowel disease that affects the lining of the large intestine (colon) and rectum. It is characterized by inflammation, ulcers, and bleeding in the colon and rectum, which can lead to symptoms such as abdominal pain, diarrhea, and rectal bleeding. The exact cause of ulcerative colitis is unknown, but it is thought to be related to an abnormal immune response in which the body's immune system attacks the cells of the digestive tract. The condition may also be influenced by genetic and environmental factors. There are several treatment options available to manage the symptoms and complications of ulcerative colitis, including medications to reduce inflammation and suppress the immune system, dietary changes, and surgery to remove the affected portion of the colon or rectum in severe cases. According to the latest estimates, the ulcerative colitis in China market size is expected to increase from USD 857.8 million in 2022 to USD 2,061.0 million by 2029, garnering a CAGR of 13.09% over the evaluated period.
