Abstracts

According to our (Global Info Research) latest study, the global 940nm Narrowband Filter market size was valued at US\$ 218 million in 2025 and is forecast to a readjusted size of US\$ 327 million by 2032 with a CAGR of 6.1% during review period.

A 940nm narrowband filter is an optical component that allows only infrared light with a wavelength of 940 nanometers to pass through, while blocking or reflecting all other wavelengths of light (such as visible light from sunlight). It achieves this through multiple layers of precision optical coatings, resulting in a very narrow passband and requiring advanced technology. The upstream supply chain involves high-purity optical glass substrates and high/low refractive index coating materials. The core barrier to entry lies in high-end vacuum ion sputtering coating equipment, which directly determines the uniformity and temperature stability of the film layers. In 2025, global sales are projected to be approximately 44.13 million units, with an average market price of approximately US\$4.8 per unit. The industry's gross profit margin is in the range of 20%–35%.
