AAV (Adeno-Associated Virus) transfection reagents are specialized materials used in molecular biology and gene therapy research to introduce foreign genetic material into cells. Specifically, these reagents are designed to package and deliver nucleic acids, such as DNA or RNA, using the natural infection mechanism of AAVs. They are a vital tool in biomedical research, the study of gene function, the creation of stable cell lines for biopharmaceutical production, and the development of gene therapies for treating genetic disorders. The reagents typically consist of AAV vectors, which are modified viruses that can efficiently transduce a wide range of cell types without causing significant disease or damage.
