According to our (Global Info Research) latest study, the global Accelerator Mass Spectrometer market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

An Accelerator Mass Spectrometer (AMS) is an advanced analytical instrument used in radiocarbon dating and other isotopic analysis applications. Unlike traditional mass spectrometers, which measure the mass-to-charge ratio of ions, AMS accelerates ions to high velocities using a particle accelerator before subjecting them to mass analysis. This acceleration allows AMS to analyze isotopic ratios with extremely high sensitivity and precision, even for rare isotopes present in very small quantities. In radiocarbon dating, AMS enables the precise determination of the ratio of carbon-14 to carbon-12 in samples, allowing scientists to accurately estimate the age of organic materials thousands to millions of years old. Additionally, AMS is used in environmental research, archaeology, geology, and forensic science to study isotopic compositions and trace elements in various materials, providing valuable insights into past environments, human history, and geological processes.
