Active vibration isolation system, in the field of chip manufacturing, is a high-precision vibration control technology that aims to reduce or eliminate the interference of external vibration on chip manufacturing equipment (such as lithography machines, thin film deposition equipment, etc.) to ensure the stability of the manufacturing process and product quality.

Based on the principle of feedback control, the active vibration isolation system monitors the vibration state of the equipment in real time, and uses the control system to calculate and output the corresponding control signal to drive the actuator to generate reverse force or displacement to actively offset or reduce the impact of external vibration on the equipment.
