Acute dialysis catheters are medical devices used to provide temporary vascular access for patients undergoing urgent or short-term hemodialysis treatments. These catheters are typically inserted into large veins, such as the jugular, subclavian, or femoral vein, and allow for the rapid removal and return of blood from the body to a dialysis machine. Unlike long-term dialysis catheters, acute dialysis catheters are intended for short-term use, usually when immediate dialysis is necessary due to acute kidney failure or other critical conditions.
