According to our (Global Info Research) latest study, the global Adhesive Liquid Embolic Materials market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Adhesive liquid embolic material is a liquid preparation that can quickly polymerize, precipitate and firmly adhere to the blood vessel wall in the blood vessel, thereby achieving the purpose of embolizing the blood vessel, isolating the blood or embolizing the diseased blood vessel. Its main characteristics are good adhesion and rapid polymerization, which can form stable emboli in the blood vessel and effectively block blood flow. The main components of adhesive liquid embolic material are usually cyanoacrylate compounds such as γ -butyl cyanoacrylate (NBCA). When these compounds come into contact with anions in the blood, they will quickly undergo polymerization to form solid emboli. In addition, in order to increase the development effect of the material, sometimes an appropriate amount of developer such as tantalum powder is added to the material. Adhesive liquid embolic material is mainly used in the clinic to treat various vascular diseases, such as cerebral arteriovenous malformations, aneurysms, etc. Through embolization therapy, the blood supply of the diseased blood vessel can be blocked, the risk of bleeding can be reduced, and the patient's symptoms and quality of life can be improved. At the same time, the material can also be used in other fields that require embolization therapy, such as tumor embolism, vascular rupture, etc.
